USER INTERFACE DESIGN

EXPERIMENT 8

TOPIC:SHOPPING APP USING BALSAMIQ

NAME : ASHIKA R
ROLL NO : 240701054

AIM:
The aim is to design and develop storyboards representing the user flow for a mobile Online Shopping Application using a wireframing tool like Balsamiq / Figma.

PROCEDURE:

The wireframe was created using a design tool such as Balsamiq or Figma. A new project was started with a mobile screen layout. Multiple screens were designed to represent the complete user journey from opening the app to placing an order. Various UI components such as buttons, text fields, images, icons, and navigation bars were used to make the design interactive and user-friendly. The focus was on creating a simple, clean, and effective interface.

USER FLOW:
The application starts with a splash screen, followed by the login or signup screen where the user enters their credentials. After logging in, the user is taken to the homepage where they can browse products and offers. From there, the user can navigate to categories, view product lists, check product details, add items to the cart, proceed to checkout, make payment, and finally receive an order confirmation.

SPLASH SCREEN:
The splash screen is the first screen of the application that displays the app logo and name along with a loading indicator. It serves as an introduction to the application and creates the first impression for the user.

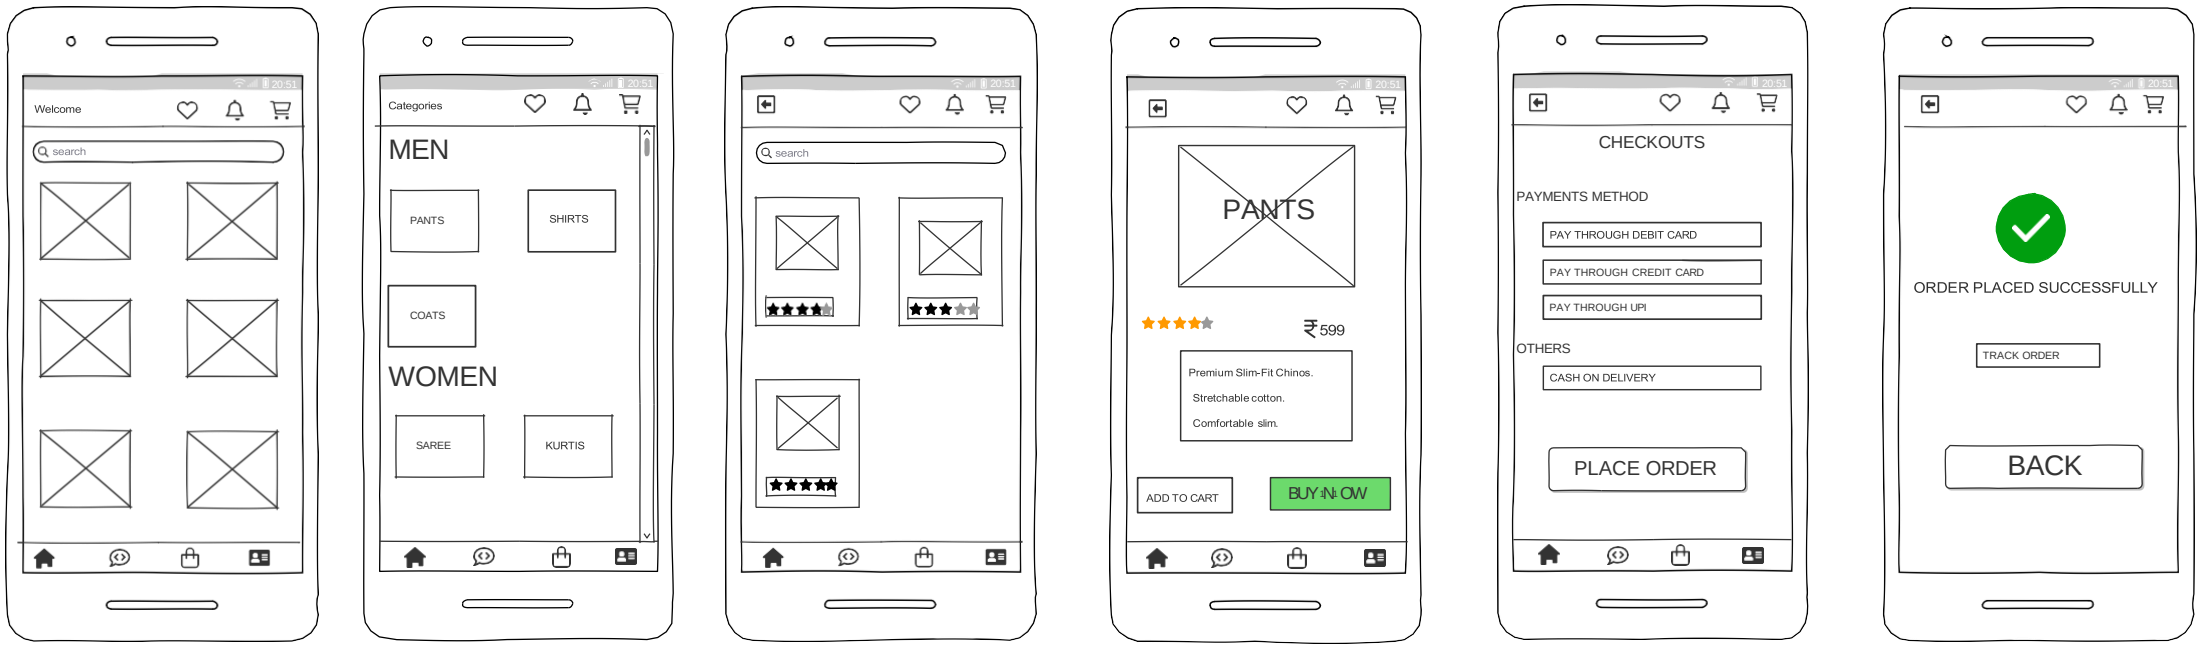
LOGIN / SIGNUP SCREEN:
The login or signup screen allows users to access their accounts securely by entering their email or phone number and password. It also provides options for new users to create an account and for existing users to recover forgotten passwords.

HOMEPAGE:
The homepage acts as the central hub of the application where users can explore products. It includes a search bar for finding items, banners displaying offers and discounts, category sections, and featured products. It also contains a navigation bar for easy movement within the app.

CATEGORIES SCREEN:
The categories screen displays different product categories such as electronics, fashion, and groceries. Each category is represented with icons or images to help users quickly identify and select their area of interest.

PRODUCT LIST SCREEN:
The product list screen shows a collection of products under a selected category. Each product is displayed with its image, name, price, and rating, along with an option to add the product to the cart.

PRODUCT DETAILS SCREEN:
The product details screen provides complete information about a selected product. It includes multiple images, product title, price, ratings, description, and options such as add to cart or buy now to help the user make a purchase decision.



CART SCREEN:
The cart screen displays all the items added by the user. It shows product details, quantity selection, total price, and options to remove items. It also includes a button to proceed to checkout.

PAYMENT SCREEN:
The payment screen provides multiple payment options such as UPI, credit or debit card, and cash on delivery. Users can enter payment details and confirm the transaction securely.

ORDER CONFIRMATION SCREEN:
The order confirmation screen displays a success message after the payment is completed. It shows the order ID, estimated delivery time, and an option to continue shopping.

CONCLUSION:
The storyboard effectively represents the complete flow of an online shopping application, ensuring smooth navigation and a user-friendly experience from browsing products to completing a purchase.
